

ACELL® MATRIX ADVANCED WOUND CARE OPTION FOR FUE AND FUT PROCEDURES

ACell MatriStem MicroMatrix is an FDA-approved regenerative therapy that stimulates the body's healing process. In hair transplantation surgery procedures, ACell MatriStem wound-healing biomaterial is placed into the recipient and donor sites where it is resorbed and replaced with new scalp tissue and hair follicles. ACell MatriStem therapy helps maximize yield and reduce scar tissue.

Shapiro Medical Group physicians highly recommend ACell MatriStem for all FUE hair transplantation procedures and most FUT (strip) procedures. The benefits of adding ACell therapy will be discussed during the consultation and on the morning of surgery. Any questions about ACell may directed to Matt Zupan, matt@shapiromedical.com.

Benefits of adding ACell MatriStem MicroMatrix therapy:

- **Improves graft survival at the recipient site**
- **Reduces and or repairs scar tissue at the donor site**

(Acell is an optional therapy. If you elect to add ACell MatriStem to your procedure there is an additional charge of \$399)

HYALURONIDASE INJECTABLE THERAPY FOR TIGHT SCALPS

Hyaluronidase is a medication that when injected into a tight donor area will cause it to gain increased flexibility and laxity. This is very helpful in some patients with tight scalps as a tight scalp can limit the number of grafts they can receive. Using this medication can increase the number of grafts a patient can receive, and it can decrease the chance of scarring.

(Hyaluronidase is an optional therapy. If you elect to add hyaluronidase to your procedure, there is an additional charge of \$199)
